| Performance Assessment Task |
| :---: |
| Granny's Balloon Trip |
| Grade 5 |

This task challenges a student to use knowledge of scale to organize and represent data from a table on graph. A student must understand scale as being comprised of equal-sized units to label the axes on the graph. A student must understand what type of graph (point, line or bar) best suits the given data set to make the appropriate graph. A student must be able to estimate distances between the grid lines to plot points and interpret the data to answer questions. A student must interpret information on a line graph and estimate values between grid lines and think about range solve problems about the data.

## Common Core State Standards Math - Content Standards

## Geometry

## Graph points on the coordinate plane to solve real-world and mathematical problems.

5.G.1 Use a pair of perpendicular number lines, called axes, to define a coordinate system, with the intersection of the lines (the origin) arranged to coincide with the 0 on each line and a given pint in the plane located by using an ordered pair of numbers, called its coordinates. Understand that the first number indicates how far to gravel from the origin in the direction of one axis, and the second number indicates how far to travel from the origin in the direction of the second axis, with the convention that the names of the two axes and coordinates correspond (e.g., x -axis and x -coordinate, y -axis and y -coordinate).
5.G. 2 Represent real world and mathematical problems by graphing points in the first quadrant of the coordinate plane and interpret coordinate values of points in the context of the situation.

## Common Core State Standards Math - Standards of Mathematical Practice MP. 2 Reason abstractly and quantitatively. <br> Mathematically proficient students make sense of quantities and their relationships in problem situations. They bring two complementary abilities to bear on problems involving quantitative relationships: the ability to decontextualize - to abstract a given situation and represent it symbolically and manipulate the representing symbols as if they have a life of their own, without necessarily attending to their referents - and the ability to contextualize, to pause as needed during the manipulation process in order to probe into the referents for the symbols involved. Quantitative reasoning entails habits of creating a coherent representation of the problem at hand; considering the units involved; attending to the meaning of quantities, not just how to compute them; and knowing and flexibly using different properties of operations and objects.

## MP. 7 Look for and make use of structure.

Mathematically proficient students try to look closely to discern a pattern or structure. Young students, for example, might notice that three and seven more is the same amount as seven and three more, or they may sort a collection of shapes according to how many sides the shapes have. Later, students will see $7 \times 8$ equals the well-remembered $7 \times 5+7 \times 3$, in preparation for learning about the distributive property. In the expression $x^{2}+9 x+14$, older students can see the 14 as $2 x 7$ and the 9 as $2+7$. They recognize the significance of an existing line in a geometric figure and can use the strategy of drawing an auxiliary line for solving problems. They also can step back for an overview and shift perspective. They can see complicated things, such as some algebraic expressions, as single objects or being composed of several objects. For example, they can see $5-3(x-y)^{2}$ as 5 minus a positive number times a square and use that to realize that its value cannot be more than 5 for any real numbers $x$ and $y$.

## Assessment Results

This task was developed by the Mathematics Assessment Resource Service and administered as part of a national, normed math assessment. For comparison purposes, teachers may be interested in the results of the national assessment, including the total points possible for the task, the number of core points, and the percent of students that scored at standard on the task. Related materials, including
the scoring rubric, student work, and discussions of student understandings and misconceptions on the task, are included in the task packet.

## Granny's Balloon Trip

This problem gives you the chance to:

- represent data using tables and graphs

On her eightieth birthday, Sarah's granny went for a trip in a hot air balloon.

This table shows the schedule of the trip.

| Time | $2: 30$ | $3: 00$ | $3: 30$ | $4: 00$ | $4: 30$ | $5: 00$ | $5: 30$ | $6: 00$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Height above <br> the ground in <br> yards | 0 | 150 | 250 | 350 | 500 | 250 | 100 | 0 |

1. Finish labeling the axes and draw a line graph to show the balloon trip.

Height above the ground in yards

2. For about how long did the balloon stay above 250 yards?
3. At about what time do you think the balloon rose to 400 yards?

Explain how you figured this out.
$\qquad$
$\qquad$
$\qquad$
4. At about what height do you think the balloon was at 5:50?

Explain how you figured this out.
$\qquad$
$\qquad$
$\qquad$

| Task 4: Granny's Balloon Trip | Rubric |  |
| :---: | :---: | :---: |
| The core elements of performance required by this task are: <br> - represent data using tables and graphs <br> Based on these, credit for specific aspects of performance should be assigned as follows | points | section points |
| 1. Completes both axes correctly <br> Completes the line graph correctly <br> Partial credit. <br> One point for a partly correct graph such as: Correct points marked but line not drawn. or Line drawn but one or two incorrect points marked. | 1 2 ft <br> (1) | 3 |
| 2. Gives correct answer: One and a half hours | 1 ft | 1 |
| 3. Gives correct answer: accept 4:05 through 4:15 <br> Gives a correct explanation such as: If you follow the line for 400 yards on the vertical axis and look down the horizontal axis it is about half way between 4:00. and 4:30. | 1 ft $1 \mathrm{ft}$ | 2 |
| 4. Gives correct answer: accept 5 through 35 yards above the ground <br> Gives a correct explanation such as: <br> It was less than 50 yards and more than 0 yards | 1 ft 1 ft | 2 |
| Total Points |  | 8 |

## Granny’s BalloonTrip

W ork the task. Look at the rubric. What are the big mathematical ideas of the task?

How often do students in your class get oppotunities to make their own graphsversus reading information off the graphsprovided?
How is the thinking needed to construct a graph different that the thinking needed to read or interpret a graph?
What oppotunities have your students had to work with linegraphs?

- In the devel opment of the idea did they discuss when onetype of graph would be more appropriate than theother?
- Why are items on the horizontal axis of a line graph located on the grid lines and items on the horizontal axis of a bar graph located between grid marks? Do you think your students undestand this distinction?
Do the graphsused in class give students oppotunities to estimate values that don't fall evenly on the grid lines?

Look at the scales made on the horizontal axis. How many of your students:

- Used increasing intervals of 50 ?
- Used increasing numbers with different size intervals?
- Numbers on the scal e matched data points rather than measuring outintervals
- Included increasing and decreasing numbers?
- Repeated some values

How many of your students madebar graphsinstead of line graphs? Why don't these make sense for this situation?
How many of your students did notfill in the points after they madethe labds on the axes? How many of your students didn't fill in the lines? Did this effect their answers on other parts of the task or were they able to get enoughinformation from the table?

Now look at student work on part 2, finding the length of time the balloon was above 250 yds. How many of your students put

| $11 / 2 \mathrm{hr}$. | 30 min. | 1 hr. | $3: 30$ | 2 hr. | $2: 30$ | $5: 00$ | Other |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |

What mighta student be thinking to get those answers? What kind of question could you pose to the class to get them to see the errors in their logic?

To answer thefinal question, students needed to think aboutdividing the time between 5:30 and 6:00 into 10 min . intervals to locate 5:50 and then read across and estimate distance on the vertical axis. Look at your student work on part 4. How many of your students put

| Correct <br> estimate | Number <br> larger than 50 | Number larger <br> than 100 | Exactly 50 | 0 | Time <br> notation <br> e.g. 4:45 <br> or 5:30 | Other |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |

What do students need to understand abouttime and aboutspatial visualization in order to solve this task?
Can you look at some of the student work to see what misconceptions may have led them to their answers? Usually there is a logic to incorrect errors. Understanding this logic can help us plan out thetypes of experiences that will help students let go of their thinking and adopt better strategies.

## Looking at Student Work on Granny's Balloon

Student A is able to label the axes in appropriate, equal size intervals matching the scale already being used. The student shows visually how he used estimation to answer questions 3 and 4. Notice that the student labeled ten-minute intervals to find the 5:50 and then work backwards to find the correct number of yards.

## Student A

This table shows the schedule of the trip.

| Time | $2: 30$ | $3: 00$ | $3: 30$ | $4: 00$ | $4: 30$ | $5: 00$ | $5: 30$ | $6: 00$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Height above <br> the ground in <br> yards | 0 | 150 | 250 | 350 | 500 | 250 | 100 | 0 |

1. Finish labeling the axes and draw a line graph to show the balloon trip.

## Student A, part 2

2. For about how long did the balloon stay above 250 yards?

3. At about what time do you think the balloon rose to 400 yards?

Explain how you figured this out.

4. At about what height do you think the balloon was at 5:50?

Explain how you figured this out.

Student B has 7 out of the 8 points on the task. The student has difficulty thinking aboutthe time the balloon is above 250 yds . The student only considers the time the balloon is still rising, forgetting that part of the descent is also above 250 yd . What question could you pose to theclass to push their thinking aboutthis issue? What other questionscould you ask to have students think abouta range of val es on the graph?

## Student B

2. For about how long did the balloon stay above 250 yards?

so it was above 250 yd. 5 For hour.

> Estimating values between grid marks was challenging for many students. Student $C$ has a reasonable strategy for estimating the distance in part 3 (althoughtheten minutes should have been added to 4:00). However this same strategy does notwork for finding the value in part 4. Can you explain why it no longe works?

## Student C

3. At about what time do you think the balloon rose to 400 yards?

Explain how you figured this out.

```
30) min }50\mathrm{ I broke that down and got 10 min. r
```

4. At about what height do you think the balloon was at $5: 50$ ?

Explain how you figured this out.
If did the same thing as what I And above except
$\qquad$
this is subtracting, $x$
Why is dividing by 2 incorrect for finding the distance for $5: 50$ Is there way to divide 100 to get a goodestimate? Look at the work of Student.
3. At about what time do you think the balloon rose to 400 yards?

Explain how you figured this out.
At 4:00 it was at 350 yards above the ground. At $v$ 4:30 it was at 500 yards. So $4: 15$ is right in the middle of those 2 .
4. At about what height do you think the balloon was at $5: 50$ ?

$$
50 \text { feet } x
$$

Explain how you figured this out.
At $5: 30$ the ballon $W$ as at 100 feet going down. $X$ At 6:00 it was at ofeet above the ground. 50 feet is right in the middle of those 2 .

While Student E's estimate for part 3 is within the allowable range, what is the student not understanding aboutproportional thinking?

## Student E

3. At about what time do you think the balloon rose to 400 yards?

## About 4.15

Explain how you figured this out.

4. At about what height do you think the balloon was at $5: 50$ ?

> Explain how you figured this out.

$\square$
and 50 is 550 .
Student $F$ is able to label the axes in equal intervals and graph the data points. The student does notshow the line for a linegraph, which may have made it more difficult to estimate values for other parts of the graph.

## Student F

1. Finish labeling the axes and draw a line graph to show the balloon trip.

## Student F, part 2

2. For about how long did the balloon stay above 250 yards?

3. At about what time do you think the balloon rose to 400 yards?

Explain how you figured this out.

$\qquad$
4. At about what height do you think the balloon was at $5: 50$ ?

Explain how you figured this out.

Student G makes a bar graph instead of line graph. The student seems to want the vertical scale to be between lines, which would imply that there aren't values in between ( the whole row would be 150 or 300 ). The same is true for the horizontal scale. Something is either at 3:30 or 4:00, but there are no values in between. It's not possible with this graph to estimate a heightfor the balloon at 3:45.

## Student G

1. Finish labeling the axes and draw a line graph to show the balloon trip.

Some students think all line graphs are linear. Student H scales the vertical axes in equal intervals, butdoesn't use the data in the table to plot the graph. The student does seem to look at the line in attempting to answer parts 3 and 4 . Why do you think a student mighthave this type of misconception aboutgraphing? What questions mightyou pose to the class?

## Student H

1. Finish labeling the axes and draw a line graph to show the balloon trip.

2. For about how long did the balloon stay above 250 yards?

3. At about what time do you think the balloon rose to 400 yards?
$\qquad$ $x$

Explain how you figured this out.

4. At about what height do you think the balloon was at $5: 50$ ?

Explain how you figured this out.
Because at 6:00 and 6,50 if 500 and
althast 550

StudentI also makes a linear graph. However this student does not dividethe horizontal scale into equad intervals or even ascending values. Notice the student skips from 3:00 to 4:30 on the horizontal axis. Both students just end the graph at the highest value 500 . In contrast to Student H, StudentJ does notseem to use either the table or the graph in answering questions aboutthe trip. What kindsof experiences does this student need? What mightbelogical next steps?

## Student I

1. Finish labeling the axes and draw a line graph to show the balloon trip.

2. For about how long did the balloon stay above 250 yards?

3. At about what time do you think the balloon rose to 400 yards?

Explain how you figured this out.
$\square$
4. At about what height do you think the balloon was at 5:50?

Explain how you figured this out.
$\square$
$x$

Undestanding how to scale the axes was quite challenging for many students. While StudentK has values at unequal intervals on the vertical axis and numbers that return to 0 , the student ignores the top of the scale to at least graph the points appropriately for the incorrect scale. Student L has unequad intervals and 250 is listed twice. Student M has listed the data values instead of providing intervals on the vertical axis. Student $N$ has 2 zeroes on the vertical axis and skips from 3:00 to 5:30 on the horizontal axis. Theline on the graph does not match the action of the data table.

## Student K

$x \times$ $x x$

1. Finish labeling the axes and draw a line graph to show the balloon trip.

## Student L

Height above the ground in yards

## Student M

## Student N

1. Finish labeling the axes and draw a line graph to show the balloon trip.
Height above the ground in yards

| Student Task | Represent data using tables and graphs Interpret information on a line <br> graph and estimate values between grid lines. |
| :--- | :--- |
| C ore I dea 5 |  |
| Data A nalysis | Display, analyze, compare and inter pret different data sets. <br> - Organize and display data in appropriate graphs and <br> representations (e.g., histograms and linegraphs). |

Based on teacher observations this is what fifth graders knew and were able to do:

- Labd theaxes
- Estimate the time when the balloon reached 400 ft .
- Graph points on a graph from a data table

Areas of difficulty for fifth graders:

- Making a scale with equad intervals
- Determining when to use a point, line, or bar graph.
- Scaling beween intervals to find the distance at 5:50.
- Thinking abouta range of values, finding how long the balloon was above 250 yards.

## MARS Test Task 4 Frequency Distribution and Bar Graph, Grade 5

Task 4 - Granny’s Balloon Trip
Mean: $3.85 \quad$ StdDev: 2.54

Table 28: Frequency Distribution of MARS Test Task 4, Grade 5

| Task 4 <br> Scores | Student <br> Count | \% at or <br> below | \% at or <br> above |
| :---: | ---: | ---: | ---: |
| 0 | 1225 | $13.2 \%$ | $100.0 \%$ |
| 1 | 968 | $23.7 \%$ | $86.8 \%$ |
| 2 | 916 | $33.5 \%$ | $76.3 \%$ |
| 3 | 1156 | $46.0 \%$ | $66.5 \%$ |
| 4 | 940 | $56.2 \%$ | $54.0 \%$ |
| 5 | 1311 | $70.3 \%$ | $43.8 \%$ |
| 6 | 943 | $80.5 \%$ | $29.7 \%$ |
| 7 | 1006 | $91.3 \%$ | $19.5 \%$ |
| 8 | 802 | $100.0 \%$ | $8.7 \%$ |

Figure 37: Bar Graph of MARS Test Task 4 Raw Scores, Grade 5

The maximum score available for this task is 8 points.
The minimum score for a level 3 response, meeting standards, is 4 points. Most students, $76 \%$, were able to label the axes in equal intervals (students with a score of 1 or 3 were able to do this, but not students with a score of 2 ). Many students, $76 \%$, could estimate a reasonable time for the balloon reaching a height of 400 yards by using their graph or the table. More than half the students, $54 \%$, could label the axes, graph most of the points, and make an estimate about timefor reaching 400 yd . Somestudents, $20 \%$, could make the graph and estimate the time to reach 400 yd . and the height of the balloon at 5:50. Almost $9 \%$ of the students could meet all the demands of the task, including f nding how long in total the balloon was above $250 \mathrm{yd} .13 \%$ of the students scored no points on the task. $83 \%$ of the students with this score attempted the task.

Granny's BalloonTrip

| Points | Understandings | M isunderstandings |
| :---: | :---: | :---: |
| 0 | $83 \%$ of the students with this score attempted the task. | Students did not understand how to label the axes. $21 \%$ had unequal intervals such as going by 50 's, 100 's, and 200 's. $10 \%$ had numbers on scale out of sequence. $10 \%$ repeated numbers, such as two 250's or two 0's. |
| 1 | Students could label the axes. | Students had trouble graphing the points. Almost 8\% did not draw lines. 8\% had points of because of the strange scales. $8 \%$ put no points on the graph. 13\% made bar graphs. A bout 5\% of the students made a graph that was a straight line going up from 0 to 500 . A bout 6\% made a line graph that didn't match the action of the story. |
| 2 | Students could estimate the time when the balloon reached 400 yds . and explain how they $f$ gured it out. They may have reasoned from their graph or from the table. | A bout 4\% of the students made each of the following incorrect answers: 4:00, 4:20, 4:25,4:30, and 4:50. |
| 4 | Students could label the axes, graph most of the data points, and estimate when the balloon would reach 400 yds . | Students had more dif culty thinking about the height of the balloon at 5:50, which involved estimating on both scales. Dividing the interval into thirds was dif cult. $21 \%$ just divided the $f$ nal line segment in half and got an answer of 50 yds , which is actually the distance at 5:30. |
| 5 | Students could label the axes, graph all the points accurately and draw line to connect the data points. They were able to estimate the time the balloon would reach 400 yds . | Students could not estimate the height at 5:50 or describe the time the balloon was above 250 yds. |
| 7 | Students could make the graph and estimate the time the balloon would reach 400 yds . and the height of the balloon at 5:50. | Students had dif culty with the idea of above 250 yds. $17 \%$ thought it was only $30 \mathrm{~min} .14 \%$ thought it was 1 hour. 5\% thought it was 2 hr . Almost 8\% put a clock time of 3:30 instead of the amount of elapsed time. 10\% put other clock times. |
| 8 | Students understood the idea of scale as equal intervals and could label the axes, graph the data points and draw the line. They could estimate using their line graph and reason about elapsed time. |  |

## Implications for Instruction

Students at this grade level should have many opportunities to make their own graphs. The thinking involved in planning the scale, labeling the axes, and setting up the graph is quite different from that required to just read information off a graph. Students at this grade level should be comfortable with a variety of graphs besides just bar graphs, including line graphs, pie graphs, and histograms. Students should start to be able to reason about which one to choose for different situations or why a particular type of graph would be inappropriate for the situation. They need to learn about attributes of graphs.
Students should also be able to think about scale in increments other than one; e.g. like 10, $50,100,30$, etc. They should also realize the difference between the scale, marking off equal size groups, and the data points, the information graphed or plotted in the interior of the grid. Many students don't realize that the scale should increase in size. The action of increasing and decreasing takes place with the data points. Understanding that the scale is a framework and the plotted points tell the action of the information is difficult for students. Some students want to draw lines going back to the origin if something goes back to zero. There are so many things to consider when making a time and distance graph. For example, take some information about a walk to school or a bicycle trip. Have students graph the information as distance from home. Then take the same information and graph it as total distance traveled. Have them discuss how the same information can look so different. (See MARS task 2006- Sixth Grade- Bike Ride)

## I deas for A ction Research

## Making Graphs for Stories

Having students make their own graphs about situations helps them to understand the logic of the graph and see how the lines do not represent the action of the story. Consider giving your students some story situations and have them make a graph of the general situation, not necessarily dealing with the issues of an exact scale. For example:

A factory cafeteria contains a vending machine selling drinks.
On a typical day:

- The machine starts half full.
- No drinks are sold before $9 \mathrm{a} . \mathrm{m}$. or after $5 \mathrm{p} . \mathrm{m}$.
- Drinks are sold at a slow rate throughout the day, except during the morning and lunch breads ( $10: 30-11$ am and 102 pm ) when there is a greater demand.
- The machine is filled up just before the lunch break. (It takes about 10 minutes to fill).

Make a sketch to the graph to show how the number of drinks in the machine might vary from 8 am to 6 pm .

What does the student have to understand about graphing to do this task? What do you think the graph might look like? What errors do you anticipate students might make? How does this help you think about how to process this activity? What are the mathematics you want to bring out or highlight as students discuss their work?
