The concept of learning progressions was critical in the development and review of the <u>Common Core State Standards</u> (CCSS). Ohio's learning progressions developed during Ohio's international benchmarking project, provided guidance to the writing committees of the CCSS. Ohio believes that the concept of learning progressions is important for the understanding and coherence of mathematical topics within and across the grade levels. The Ohio Department of Education has reformatted the CCSS by domains to show the progression of concepts and skills across the grade levels.

This document is not designed to replace the CCSS. Instead, it should serve as a companion document to be used by curriculum leaders and teachers to better understand the CCSS and to analyze where their curriculum fits within the standards progression of learning for their students. The following examples are ways to use this document for professional learning communities and curriculum development.

Multi-grade groups of teachers

Example 1: Select a domain, beginning at the lowest grade of the domain identify the main concepts at that grade. Follow each concept progressing through the grades by identifying how the concept changes and increases in rigor and understanding for the student. Additionally, identify new concepts that are introduced in subsequent grades and follow them through the years.

Example 2: Building on example one, begin to identify the connections among the standards progressions. For instance, how is Measurement and Data connected (used to develop the essential understandings) to other topics in grades 6-8? How is Measurement and Data used in the service of learning other concepts and skills in K-5?

Example 3: Use the standards progressions to identify where concepts and skills have moved. Some concepts and skills have moved to earlier grades, other to later grades.

Grade level or individual teachers

Example 4: In partnership with regular classroom formative assessment, teachers can use these documents to assist in identifying student progress or gaps, and then develop supports to accelerate the students in an effort to bring their understandings and skills to the appropriate level or to go deeper into the content. Note that going deeper does not imply going to the next level in the progression, rather building stronger understandings of the content or making connections to other concepts or skills.

Example 5: It is important to make connections among the standards; between standards within a domain, between standards within a cluster, and between clusters across domains. The <u>Mathematics – K-8 Critical Areas of Focus</u> should also be used for making connections.

Standards Progressions

Counting and Cardinality

Kindergarten

Know number names and the count sequence.

- 1. Count to 100 by ones and by tens.
- 2. Count forward beginning from a given number within the known sequence (instead of having to begin at 1).
- 3. Write numbers from 0 to 20. Represent a number of objects with a written numeral 0-20 (with 0 representing a count of no objects).

Count to tell the number of objects.

- 4. Understand the relationship between numbers and quantities; connect counting to cardinality.
- a. When counting objects, say the number names in the standard order, pairing each object with one and only one number name and each number name with one and only one object.
- b. Understand that the last number name said tells the number of objects counted. The number of objects is the same regardless of their arrangement or the order in which they were counted.
- c. Understand that each successive number name refers to a quantity that is one larger.
- 5. Count to answer "how many?" questions about as many as 20 things arranged in a line, a rectangular array, or a circle; or as many as 10 things in a scattered configuration; given a number from 1-20, count out that many objects.

Compare numbers.

- 6. Identify whether the number of objects in one group is greater than, less than, or equal to the number of objects in another group, e.g., by using matching and counting strategies.1
- 7. Compare two numbers between 1 and 10 presented as written numerals.

Work with numbers 14-19 to gain foundations for place value. 1. Compose and decompose numbers from 11 to 19 into ten ones and some freed and write numerals and properties of portations to the end and write numerals and represent a number of objects with a writen numeral. 2. Understand that the two digits of a subunder of composition or decomposition or decomposit or decomposition or decomposition or decomposition or decomposi			Number and Oper	ations in Base Ten		
an inclinations for piace value. 1. Compose and decompose number less that 12.0 In this range, road and with numerals and represent an number of objects with a written numeral. 2. Understand place value. 3. Compare two two-digit number persents and ones. Understand the three digits of a form ones. 4. Each put sing objects or drawing, and record each composition to the decimposition of the ones and ones. Understand the three throught of as a bunded of ten ones and ones. Understand the three numbers are composed of ten ones and ones. Understand the three numbers are composed of ten ones and ones. Understand the three numbers are composed of ten ones and ones. Understand the three numbers from 11 to 19 are composed of ten ones and ones. (bright, or nine ones.) 2. Compare two two-digit numbers and ones digits, recording the results of comparisons. White, four, five, six, seven, eight, or nine ones. 3. Compare two two-digit numbers and ones digits, recording the results of comparisons that the seven three digits in one and ones digits, recording the results of comparisons with the symbols >, and ones. (bright, or line has other three digits in one and ones digits, recording the results of comparisons with the symbols >, and ones. (bright, or line has other three digit numbers and ones digits, recording the results of comparisons with the symbols >, and ones digits, using y-, and < ymbols three digits in one and one subtract. 4. Compare two two-digit numbers and ones digits, recording the results of comparisons to add and subtract. 4. Compare two two-digit numbers and one-sign three digits in one and one subtract. 4. Compare two two-digit numbers and one-sign of the tense and ones digits, recording the results of comparisons. 5. Fluently add and subtract white digits whole numbers to a dark of the results of comparisons. 5. ones and some further numeral. Understand place value. 2. Understand that the two digits of a two-digit numbers represent amounts of tense numbers are composed of ten ones and one, two, three, four, five, six, seven, eight, or nine ones. 2. The numbers from 1 to 19 are composed of a ten and one, two, three, four, five, six, seven, eight, or nine ones. 3. The numbers from 1 to 19 are composed of ten ones and one, two, three, four, five, six, seven, eight, or nine ones. 4. The numbers from 1 to 19 are composed of the tens and ones digits, recording the results of comparisons with the symbols >=, and < 2. Count within 100, including adding and subtract. 5. The numbers of the tens and ones digits, recording the results of comparisons with the symbols >=, and < 3. Compare two two-digit numbers assed on meanings of the tens and ones digits, recording the results of comparisons. 5. Compare two two-digit numbers to add and subtract. 6. Like place value understanding and properties of operations to add and subtract. 7. Bue place value understanding and properties of operations to add and subtract. 8. Fluently add and subtract it within 100, using strategies based on place value, of the results of comparisons. 9. Compare two two-digit numbers are adding and properties of operations to add and subtract. 1. Fluently add and subtract it within 1000 using strategies based on place value, of the related a "hundred" to rive, fluence of the results of comparisons. 1. The number of the results of comparisons. 2. Count within 1000, 500, 500, 500, 600, 500, 600, 500, 600, 6	1. Compose and decompose		of hundreds, tens, and ones; e.g., 706		Recognize that in a multi-digit	
So, by using objects or drawings, and record each composition or decomposition by a drawing or equation (e.g., 18 = 10 + 8); understand that the two digits of a two-digit number represent amounts of ten ones and ones. Understand the following as special cases: a. 10 can be thought of as a b under to ten ines — called a "tunderful". b. The numbers are composed of ten ones and one, two, three, four, five, six, seven, eight, or nine ones. a. 10 can be thought of as a b under to ten ones — called a "tunderful". b. The numbers from 11 to 19 are composed of a ten and one, two, three, four, five, six, seven, eight, or nine ones. c. The numbers 10, 20, 30, 40, 50, 60, 70, 80, 90 refer to one, two, three, four, five, six, seven, eight, or nine ones. a. 2. Count within 1000; skip-count by 5s, 10s, and 100s. 3. Compare two two-digit numbers to comparisons with the symbols >, =, and <, symbols to record the results of comparisons with the symbols >, =, and <, symbols to record the results of comparisons with the symbols >, =, and <, symbols to record the results of comparisons with the symbols >, =, and <, symbols to record the results of comparisons with the symbols >, =, and <, symbols to record the results of comparisons with the symbols >, =, and <, symbols to record the results of comparisons with the symbols >, =, and <, symbols to record the results of comparisons with the symbols >, =, and <, symbols to record the results of comparisons to particular and a multiple of 10, using strategies based on place value, properties of operations to add and subtract. 4. Add within 100, including adding a two-digit numbers and adding at two-digit number and a multiple of 10, using strategies based on place value, properties of operations to add and subtract. 4. Compare two two-digit numbers using base-ten numerals, number and a properties of operations to add and subtract. 4. Compare two two-digit numbers to any place. B. Fluently add and subtract within 100 can be thought of the inelationship between addition and su	numbers from 11 to 19 into ten		•	to round whole numbers to the	whole number, a digit in one place	represents 10 times as much as it
Understand that the two digits or a two-digit number represent amounts of the same and ones. Understand that the see numbers rear composed of the ones and ones, wo, three, four, five, six, seven, eight, or nine ones. 2. Understand that the two digits numbers from 11 to 19 are composed of 18 = 10 + 8); understand that the see numbers rear composed of 18 = 10 + 8); understand that the see numbers rear composed of 18 = 10 + 8); understand that the see numbers rear composed of 18 = 10 + 80; understand that the see numbers rear composed of 18 = 10 + 80; understand that the see numbers rear composed of 18 = 10 + 80; understand that the see numbers rear composed of 18 = 10 + 80; understand that the see numbers rear composed of 18 = 10 + 80; understand that the see numbers rear composed of 18 = 10 + 80; understand that the see numbers rear composed of 18 = 10 + 80; understand that the see numbers rear composed of 18 = 10 + 80; understand that the see numbers rear composed of 18 = 10 + 80; understand that the see numbers rear composed of 18 = 10 + 80; understand that the see numbers rear composed of 18 = 10 + 80; understand that the see numbers rear composed of 18 = 10 + 80; understand that the see numbers rear composed of 18 = 10 + 80; understand that the see numbers rear composed of 18 = 10 + 80; understand that the see numbers rear composed of 18 = 10 + 80; understand that the seed on 18 = 10 + 80; understand that the seed on 18 = 10 + 80; understand that the seed on 18 = 10 + 80; understand that the seed on 18 = 10 + 80; understand that the seed on 18 = 10 + 80; understand that the seed on 18 = 10 + 80; understand that the seed on 18 = 10 + 80; understand that the seed on 18 = 10 + 80; understand that the seed on 18 = 10 + 80; understand that the seed on 18 = 10 + 80; understand that the seed on 18 = 10 + 80; understand that the seed on 18 = 10 + 80; understand that the seed on 18 = 10 + 80; understand that the seed on 18 = 10 + 80; understand that the seed on 18 = 10 + 80; understand that the seed on 18 = 10 + 80;	ones and some further ones,		ones. Understand the following as			, ,
who digit number represent amounts of by a drawing or equation (e.g., 18 = 10 + 8); understand that these numbers are composed of ten ones excelled a "thunderst, out, five, six, seven, eight, or nine ones. 1. To can be thought of as a bundle of ten ones, excelled a "thunderst, out, five, six, seven, eight, or nine ones. 2. Explain patterns in the number of by applying concepts of place value, the relationship between addition and subtraction. 3. Multiply one-digit whole numbers to within 100; skip-count by 55, 108, and 100s. 3. Read and write numbers to 200, 50, 70, 80, 90 refer to one, two, three, four, five, six, seven, eight, or nine ones. 3. Compare two two-digit numbers and explain patterns in the number of by applying concepts of place value, the relationship between addition and subtraction. 3. Multiply one-digit whole numbers to within 100; skip-count by 55, 108, and 100s. 3. Read and write numbers to 100 understand that these numbers and ones, two, three, four, five, six, seven, eight, or nine ones. 4. Compare two two-digit numbers and explaint seven and ones digits, using ya. =, and < symbols to record the results of comparisons with the symbols >, =, and < symbols to record the results of comparisons. 4. Add within 100, including adding a two-digit number and a one-digit number and a multiple of 10, using strategies based on place value, and division. 4. Add within 100, including adding a two-digit number and a multiple of 10, using concepts of place value and properties of operations to add and subtract within 100 using strategies based on place value, and properties of operations. 4. Add within 100, including adding a two-digit number and a multiple of 10, using concepts of 10, and evalue, and evalue and the properties of operations. 5. Fluently add and subtract within 100 using strategies based on place value, and evalue and the properties of operations. 5. Explain patterns in the number of both one digits whole numbers and division. 5. Multiply one-digit whole numbers the realized i		=	•	II		
by a drawing or equation (e.g., 18 = 10 + 8); understand that these numbers are composed of the ones and one, two, three, four, five, six, seven, eight, or nine ones. In the numbers 100, 20, 30, 40, 50, 60, 500, 700, 800, 900 prefer to one, two, three, four, five, six, seven, eight, or nine ones. In the numbers 10, 20, 30, 40, 50, 60, 700, 800, 900 prefer to one, two, three, four, five, six, seven, eight, or nine ones. In the numbers 10, 20, 30, 40, 50, 60, 70, 80, 90 refer to one, two, three, four, five, six, seven, eight, or nine ones. Read and write numbers to 1000 value and properties of operations. 5. Read and write numbers to 1000 value and properties of operations. 5. Read and write numbers to 2000 value understanding of operations to perform multi-digit arithmetic. 6. Fluently add and subtract multi-digit twole numbers of any place. 6. Fluently add and subtract multi-digit twole numbers of up to four digits by a one-digit number and a one-digit number and a one-digit number and a multiple of 10, using concrete models or drawings and strategies based on place value, and properties of operations. 6. Add up to four two-digit numbers to and write numbers to any place. 7. Fluently add and subtract multiply a whole number of up to four digits by a one-digit whole number of up to four digits by a one-digit whole number of up to four digits by a one-digit whole number of up to four digits by a one-digit whole number of up to four digits by a one-digit whole number of up to four digits by a one-digit whole number of up to four digits by a one-digit whole number of up to four digits by a one-digit whole number of up to four digits by a one-digit number, such graphs and subtract. 6. Add up to four two-digit numbers to and properties of operations, and/or the results of comparisons. 7. Evently and or very an addition and subtract within 100 using strategies based on place value, and cympace decimals to comparisons. 8. Read and write numbers to any place value understanding or comparisons. 9. Fluently add and subtract multiplicity whole numbers of up to four digits by a one-digit numb	nine ones.		1	, , ,		-
sing base-ten numerals, number names, and expanded form. 4. Compare two two-digit numbers based on meanings of the tens and ones digits, recording the results of comparisons with the symbols >, =, and <. Use place value understanding and properties of operations to add and subtract. 4. Add within 100, including adding a two-digit number, and adding a two-digit number and a multiple of 10, using concrete models or drawings and strategies based on place value, and properties of operations. S. Read with all properties of operations. S. Read, which all properties of operations to any place. Use place value understanding to numbers understanding to properties of operations and properties of operations to			1			•
To, 80, 90 refer to one, two, three, four, five, six, seven, eight, or nine tens (and 0 ones). 3. Compare two two-digit numbers based on meanings of the tens and ones digits, recording the results of comparisons with the symbols >, =, and <. Use place value understanding and properties of operations to add and subtract. 4. Add within 100, including adding a two-digit number and a one-digit number and a one-digit number and a diding a two-digit number and a diding a two-digit number and a multiple of 10, using concrete models or drawings and strategies based on place value, and properties of operations. Is place value understanding to round multi-digit whole numbers to any place. Use place value understanding and properties of operations to add and subtract within 100 using strategies based on place value, and properties of operations. Is place value understanding to round multi-digit whole numbers to any place. Use place value understanding and properties of operations to add and subtract within 100 using strategies based on place value, and properties of operations. Is place value understanding to round multi-digit whole numbers to any place. Use place value understanding and properties of operations to perform multi-digit arithmetic. 4. Fluently add and subtract multi-digit whole number of up to four digits by a one-digit number of up to four digits by a one-digit number, and multiply two two-digit numbers, using strategies based on place value understanding to round multi-digit whole numbers to any place. 5. Fluently add and subtract multi-digit whole number of up to four digits by a one-digit whole number of up to four digits by a one-digit number, and multiply two two-digit numbers, using strategies based on place value understanding to round multi-digit whole numbers and any place. 5. Fluently add and subtract multi-digit whole number of up to four digits by a one-digit whole number of up to four digits by a one-digit whole number of up to four digits by a one-digit number, and multiply two tw					1 -	
four, five, six, seven, eight, or nine tens (and 0 ones). 3. Compare two two-digit numbers based on meanings of the tens and ones digits, recording the results of comparisons with the symbols >, =, and <. Use place value understanding and properties of operations to add and subtract. Use place value understanding and properties of operations to add and subtract. 4. Number and Operations - Fractions Grade Three Grade Four Grade 5 Develop understanding of fractions as numbers. Extend understanding of fraction equivalence and ordering. Use equivalent fractions as a strategy to add and subtract fractions. 1. Understand a fraction 1/b as the quantity formed by 1 1. Explain why a fraction a/b is equivalent to a fraction $(n \times a)/(n \times b)$ by using visual 1. Add and subtract fractions with unlike denominators (including mixed numbers) by part when a whole is partitioned into b equal parts: fraction models, with attention to how the number and size of the parts differ even replacing given fractions with equivalent fractions in such a way as to produce an understand a fraction a/b as the quantity formed by a though the two fractions themselves are the same size. Use this principle to equivalent sum or difference of fractions with like denominators. recognize and generate equivalent fractions. For example, 2/3 + 5/4 = 8/12 + 15/12 = 23/12. (In general, a/b + c/d = (ad + bc)/bd.) parts of size 1/b. 2. Solve word problems involving addition and subtraction of fractions referring to the 2. Understand a fraction as a number on the number line; 2. Compare two fractions with different numerators and different denominators, e.g., same whole, including cases of unlike denominators, e.g., by using visual fraction represent fractions on a number line diagram. by creating common denominators or numerators, or by comparing to a benchmark models or equations to represent the problem. Use benchmark fractions and number a. Represent a fraction 1/b on a number line diagram by fraction such as 1/2. Recognize that comparisons are valid only when the two defining the interval from 0 to 1 as the whole and fractions refer to the same whole. Record the results of comparisons with symbols >, sense of fractions to estimate mentally and assess the reasonableness of answers. For example, recognize an incorrect result 2/5 + 1/2 = 3/7, by observing that 3/7 < 1/2. partitioning it into b equal parts. Recognize that each part =, or <, and justify the conclusions, e.g., by using a visual fraction model. Apply and extend previous understandings of multiplication and division to has size 1/b and that the endpoint of the part based at 0 Build fractions from unit fractions by applying and extending previous multiply and divide fractions. locates the number 1/b on the number line. understandings of operations on whole numbers. 3. Interpret a fraction as division of the numerator by the denominator $(a/b = a \div b)$. b. Represent a fraction a/b on a number line diagram by 3. Understand a fraction a/b with a > 1 as a sum of fractions 1/b. Solve word problems involving division of whole numbers leading to answers in the marking off a lengths 1/b from 0. Recognize that the a. Understand addition and subtraction of fractions as joining and separating parts form of fractions or mixed numbers, e.g., by using visual fraction models or resulting interval has size a/b and that its endpoint locates referring to the same whole. equations to represent the problem. b. Decompose a fraction into a sum of fractions with the same denominator in more the number a/b on the number line. For example, interpret 3/4 as the result of dividing 3 by 4, noting that 3/4 multiplied by 4 equals 3. Explain equivalence of fractions in special cases, and than one way, recording each decomposition by an equation. Justify 3, and that when 3 wholes are shared equally among 4 people each person has a share of size compare fractions by reasoning about their size. decompositions, e.g., by using a visual fraction model. 3/4. If 9 people want to share a 50-pound sack of rice equally by weight, how many pounds of Examples: 3/8 = 1/8 + 1/8 + 1/8; 3/8 = 1/8 + 2/8; 21/8 = 1 + 1 + 1/8 = 8/8 + 8/8 + 1/8. a. Understand two fractions as equivalent (equal) if they rice should each person get? Between what two whole numbers does your answer lie? c. Add and subtract mixed numbers with like denominators, e.g., by replacing each are the same size, or the same point on a number line. 4. Apply and extend previous understandings of multiplication to multiply a fraction or mixed number with an equivalent fraction, and/or by using properties of operations b. Recognize and generate simple equivalent fractions, whole number by a fraction. and the relationship between addition and subtraction. e.g., 1/2 = 2/4, 4/6 = 2/3). Explain why the fractions are a. Interpret the product $(a/b) \times q$ as a parts of a partition of q into b equal parts: d. Solve word problems involving addition and subtraction of fractions referring to the equivalent, e.g., by using a visual fraction model. equivalently, as the result of a sequence of operations $a \times q \div b$. same whole and having like denominators, e.g., by using visual fraction models and c. Express whole numbers as fractions, and recognize For example, use a visual fraction model to show $(2/3) \times 4 = 8/3$, and create a story context for equations to represent the problem. fractions that are equivalent to whole numbers. this equation. Do the same with $(2/3) \times (4/5) = 8/15$. (In general, $(a/b) \times (c/d) = ac/bd$.) 4. Apply and extend previous understandings of multiplication to multiply a fraction Examples: Express 3 in the form 3 = 3/1; recognize that b. Find the area of a rectangle with fractional side lengths by tiling it with unit by a whole number. 6/1 = 6; locate 4/4 and 1 at the same point of a number squares of the appropriate unit fraction side lengths, and show that the area is the a. Understand a fraction a/b as a multiple of 1/b. line diagram. same as would be found by multiplying the side lengths. Multiply fractional side For example, use a visual fraction model to represent 5/4 as the product $5 \times (1/4)$, recording d. Compare two fractions with the same numerator or the lengths to find areas of rectangles, and represent fraction products as rectangular the conclusion by the equation $5/4 = 5 \times (1/4)$. same denominator by reasoning about their size. b. Understand a multiple of a/b as a multiple of 1/b, and use this understanding to Recognize that comparisons are valid only when the two 5. Interpret multiplication as scaling (resizing), by: multiply a fraction by a whole number. fractions refer to the same whole. Record the results of a. Comparing the size of a product to the size of one factor on the basis of the size For example, use a visual fraction model to express $3 \times (2/5)$ as $6 \times (1/5)$, recognizing this comparisons with the symbols >, =, or <, and justify the of the other factor, without performing the indicated multiplication.

c. Solve word problems involving multiplication of a fraction by a whole number, e.g.,

For example, if each person at a party will eat 3/8 of a pound of roast beef, and there will be 5

by using visual fraction models and equations to represent the problem.

product as 6/5. (In general, $n \times (a/b) = (n \times a)/b$.)

conclusions, e.g., by using a visual fraction model.

b. Explaining why multiplying a given number by a fraction greater than 1 results in a

product greater than the given number (recognizing multiplication by whole numbers

greater than 1 as a familiar case); explaining why multiplying a given number by a

	Number and Operations - Fractions	
Grade Three	Grade Four	Grade 5
	people at the party, how many pounds of roast beef will be needed? Between what two whole numbers does your answer lie? Understand decimal notation for fractions, and compare decimal fractions. 5. Express a fraction with denominator 10 as an equivalent fraction with denominator 100, and use this technique to add two fractions with respective denominators 10 and 100. For example, express 3/10 as 30/100, and add 3/10 + 4/100 = 34/100. 6. Use decimal notation for fractions with denominators 10 or 100. For example, rewrite 0.62 as 62/100; describe a length as 0.62 meters; locate 0.62 on a number line diagram. 7. Compare two decimals to hundredths by reasoning about their size. Recognize that comparisons are valid only when the two decimals refer to the same whole. Record the results of comparisons with the symbols >, =, or <, and justify the conclusions, e.g., by using a visual model.	fraction less than 1 results in a product smaller than the given number; and relating the principle of fraction equivalence $a/b = (n \times a)/(n \times b)$ to the effect of multiplying a/b by 1. 6. Solve real world problems involving multiplication of fractions and mixed numbers, e.g., by using visual fraction models or equations to represent the problem. 7. Apply and extend previous understandings of division to divide unit fractions by whole numbers and whole numbers by unit fractions. a. Interpret division of a unit fraction by a non-zero whole number, and compute such quotients. For example, create a story context for $(1/3) \div 4$, and use a visual fraction model to show the quotient. Use the relationship between multiplication and division to explain that $(1/3) \div 4 = 1/12$ because $(1/12) \times 4 = 1/3$. b. Solve real world problems involving division of unit fractions by non-zero whole numbers and division of whole numbers by unit fractions, e.g., by using visual fraction models and equations to represent the problem. For example, how much chocolate will each person get if 3 people share 1/2 lb of chocolate equally? How many 1/3-cup servings are in 2 cups of raisins? Ohio Department of Education (2/14/12)

Standards Progressions

Operations and Algebraic Thinking Grade Three

Understand addition as putting together and adding to, and understand subtraction as taking apart and taking from.

Kindergarten

- 1. Represent addition and subtraction with objects, fingers, mental images, drawings², sounds (e.g., claps), acting out situations, verbal explanations, expressions, or equations. 2. Solve addition and
- subtraction word problems, and add and subtract within 10, e.g., by using objects or drawings to represent the problem.
- 3. Decompose numbers less than or equal to 10 into pairs in more than one way, e.g., by using objects or drawings, and record each decomposition by a drawing or equation (e.g., 5 = 2 + 3 and 5 = 4 + 1).
- 4. For any number from 1 to 9, find the number that makes 10 when added to the given number, e.g., by using objects or drawings, and record the answer with a drawing or equation.
- 5. Fluently add and subtract within 5.

Represent and solve problems involving addition and subtraction.

Grade One

- 1. Use addition and subtraction within 20 to solve word problems involving situations of adding to, taking from, putting together, taking apart, and comparing, with unknowns in all positions, e.g., by using objects, drawings, and equations with a symbol for the unknown number to represent the problem.
- 2. Solve word problems that call for addition of three whole numbers whose sum is less than or equal to 20, e.g., by using objects, drawings, and equations with a symbol for the unknown number to represent the problem.

Understand and apply properties of operations and the relationship between addition and subtraction.

- 3. Apply properties of operations as strategies to add and subtract Examples: If 8 + 3 = 11 is known, then 3 + 8 =11 is also known. (Commutative property of addition.) To add 2 + 6 + 4, the second two numbers can be added to make a ten, so 2 + 6 +4=2+10=12. (Associative property of addition.)
- 4. Understand subtraction as an unknown-addend problem. For example, subtract 10 – 8 by finding the number that makes 10 when added to 8.

Add and subtract within 20.

- 5. Relate counting to addition and subtraction (e.g., by counting on 2 to add
- 6. Add and subtract within 20, demonstrating fluency for addition and

Grade Two

Represent and solve problems involving addition and subtraction.

1. Use addition and subtraction within 100 to solve one- and two-step word problems involving situations of adding to, taking from, putting together, taking apart, and comparing, with unknowns in all positions, e.g., by using drawings and equations with a symbol for the unknown number to represent the problem.

Add and subtract within 20.

2. Fluently add and subtract within 20 using mental strategies.² By end of Grade 2, know from memory all sums of two one-digit numbers.

Work with equal groups of objects to gain foundations for multiplication.

- 3. Determine whether a group of objects (up to 20) has an odd or even number of members, e.g., by pairing objects or counting them by 2s; write an equation to express an even number as a sum of two equal addends.
- 4. Use addition to find the total number of objects arranged in rectangular arrays with up to 5 rows and up to 5 columns;

Represent and solve problems involving multiplication and division.

- 1. Interpret products of whole numbers, e.g., interpret 5×7 as the total number of objects in 5 groups of 7 objects each. For example, describe a context in which a total number of objects can be expressed as 5×7 . 2. Interpret whole-number quotients of whole numbers, e.g., interpret 56 ÷ 8 as the
- number of objects in each share when 56 objects are partitioned equally into 8 shares, or as a number of shares when 56 objects are partitioned into equal shares of 8 objects each.
- For example, describe a context in which a number of shares or a number of groups can be expressed as 56 ÷ 8.
- 3. Use multiplication and division within 100 to solve word problems in situations involving equal groups, arrays, and measurement quantities,
- e.g., by using drawings and equations with a symbol for the unknown number to represent the problem.1
- 4. Determine the unknown whole number in a multiplication or division equation relating three whole numbers.

For example, determine the unknown number that makes the equation true in each of the equations $8 \times ? = 48, 5 = \div 3, 6 \times 6 = ?$.

Understand properties of multiplication and the relationship between multiplication and division.

5. Apply properties of operations as strategies to multiply and divide.2 Examples: If $6 \times 4 = 24$ is known, then $4 \times 6 =$ 24 is also known. (Commutative property of

Grade Four

Use the four operations with whole numbers to solve problems.

- 1. Interpret a multiplication equation as a comparison, e.g., interpret $35 = 5 \times 7$ as a statement that 35 is 5 times as many as 7 and 7 times as many as 5. Represent verbal statements of multiplicative comparisons as multiplication equations.
- 2. Multiply or divide to solve word problems involving multiplicative comparison, e.g., by using drawings and equations with a symbol for the unknown number to represent the problem, distinguishing multiplicative comparison from additive comparison.1
- 3. Solve multistep word problems posed with whole numbers and having whole-number answers using the four operations, including problems in which remainders must be interpreted. Represent these problems using equations with a letter standing for the unknown quantity.

Assess the reasonableness of answers using mental computation and estimation strategies including roundina.

Gain familiarity with factors and multiples.

4. Find all factor pairs for a whole

Grade Five

Write and interpret numerical expressions.

- 1. Use parentheses, brackets, or braces in numerical expressions, and evaluate expressions with these symbols.
- 2. Write simple expressions that record calculations with numbers, and interpret numerical expressions without evaluating

For example, express the calculation "add 8 and 7, then multiply by 2" as 2 × (8 + 7). Recognize that $3 \times (18932 +$ 921) is three times as large as 18932 + 921, without having to calculate the indicated sum or product.

Analyze patterns and relationships.

3. Generate two numerical patterns using two given rules. Identify apparent relationships between corresponding terms. Form ordered pairs consisting of corresponding terms from the two patterns, and graph the ordered pairs on a coordinate plane.

For example, given the rule "Add 3" and the starting number 0, and given the rule "Add 6" and the starting number 0, generate terms in the resulting sequences, and observe that the terms in one sequence are twice the corresponding terms in the other sequence. Explain informally why this is

Standards Progressions

subtraction within 10. Use strategies such as counting on; making ten (e.g., $8+6=8+2+4=10+4=10$); decomposing a number leading to a ten (e.g., $13-4=13-3-1=10-1=9$); using the relationship between addition and subtraction (e.g., knowing that $8+4=12$, one knows $12-8=4$); and creating equivalent but easier or known sums (e.g., adding $6+7$ by creating the known equivalent $6+6+1=12+1=13$). Work with addition and subtraction equations. 7. Understand the meaning of the equal sign, and determine if equations involving addition and subtraction are true or false. For example, which of the following equations are true and which are false? $6=6$, $7=8-1$, $5+2=2+5$, $4+1=5+2$. 8. Determine the unknown number in a whole-number addition or subtraction equation. For example, determine the unknown number that makes the equation true in each of the equations $8+?=11$, $5=-3$, $6+6=-1$.	write an equation to express the total as a sum of equal addends.	multiplication.) $3 \times 5 \times 2$ can be found by $3 \times 5 = 15$, then $15 \times 2 = 30$, or by $5 \times 2 = 10$, then $3 \times 10 = 30$. (Associative property of multiplication.) Knowing that $8 \times 5 = 40$ and $8 \times 2 = 16$, one can find 8×7 as $8 \times (5 + 2) = (8 \times 5) + (8 \times 2) = 40 + 16 = 56$. (Distributive property.) 6. Understand division as an unknownfactor problem. For example, find $32 \div 8$ by finding the number that makes 32 when multiplied by 8 . Multiply and divide within 100 . 7. Fluently multiply and divide within 100 , using strategies such as the relationship between multiplication and division (e.g., knowing that $8 \times 5 = 40$, one knows $40 \div 5 = 8$) or properties of operations. By the end of Grade 3 , know from memory all products of two one-digit numbers. Solve problems involving the four operations, and identify and explain patterns in arithmetic. 8. Solve two-step word problems using the four operations. Represent these problems using equations with a letter standing for the unknown quantity. Assess the reasonableness of answers using mental computation and estimation strategies including rounding. 9. Identify arithmetic patterns (including patterns in the addition table or multiplication table), and explain them using properties of operations. For example, observe that 4 times a number is always even, and explain why 4 times a number can be decomposed into two equal addends.	number in the range 1–100. Recognize that a whole number is a multiple of each of its factors. Determine whether a given whole number in the range 1–100 is a multiple of a given one-digit number. Determine whether a given whole number in the range 1–100 is prime or composite. Generate and analyze patterns. 5. Generate a number or shape pattern that follows a given rule. Identify apparent features of the pattern that were not explicit in the rule itself. For example, given the rule "Add 3" and the starting number 1, generate terms in the resulting sequence and observe that the terms appear to alternate between odd and even numbers. Explain informally why the numbers will continue to alternate in this way.

Organize, represent, and the numbers of objects interpret data with up to three in each category and categories; ask and answer sort the categories by questions about the total number of data points, how many in each category, and how many more or less are in one category than in another.

- within 100 to solve word problems involving lengths that are given in the same units, e.g., by using drawings (such as drawings of rulers) and equations with a symbol for the unknown number to represent the problem.
- 6. Represent whole numbers as lengths from 0 on a number line diagram with equally spaced points corresponding to the

using rulers marked with halves and fourths of an inch. Show the data by making a line plot, where the horizontal scale is marked off in appropriate units whole numbers, halves, or quarters.

Geometric measurement: understand concepts of area and relate area to multiplication and to addition.

- 5. Recognize area as an attribute of plane figures and understand concepts of area measurement.
- a. A square with side length 1 unit, called "a unit square," is said to have "one square unit" of area, and can be used to measure area.

- using diagrams such as number line diagrams that feature a measurement scale.
- 3. Apply the area and perimeter formulas for rectangles in real world and mathematical problems.

For example, find the width of a rectangular room given the area of the flooring and the length, by viewing the area formula as a multiplication equation with an unknown factor.

Represent and interpret data.

4. Make a line plot to display a data set of measurements in fractions of a unit (1/2,

and to addition.

- 3. Recognize volume as an attribute of solid figures and understand concepts of volume measurement.
- a. A cube with side length 1 unit, called a "unit cube," is said to have "one cubic unit" of volume, and can be used to measure volume.
- b. A solid figure which can be packed without gaps or overlaps using *n* unit cubes is said to have a volume of *n* cubic units.
- 4. Measure volumes by counting unit

		numbers 0, 1, 2,, and represent whole-number sums and differences within 100 on a number line diagram. Work with time and money. 7. Tell and write time from analog and digital clocks to the nearest five minutes, using a.m. and p.m. 8. Solve word problems involving dollar bills, quarters, dimes, nickels, and pennies, using \$ and ¢ symbols appropriately. Example: If you have 2 dimes and 3 pennies, how many cents do you have? Represent and interpret data. 9. Generate measurement data by measuring lengths of several objects to the nearest whole unit, or by making repeated measurements of the same object. Show the measurements by making a line plot, where the horizontal scale is marked off in whole-number units. 10. Draw a picture graph and a bar graph (with single-unit scale) to represent a data set with up to four categories. Solve simple put together, take-apart, and compare problems ⁴ using information presented in a bar graph.	 b. A plane figure which can be covered without gaps or overlaps by <i>n</i> unit squares is said to have an area of <i>n</i> square units. 6. Measure areas by counting unit squares (square cm, square m, square in, square ft, and improvised units). 7. Relate area to the operations of multiplication and addition. a. Find the area of a rectangle with whole-number side lengths by tiling it, and show that the area is the same as would be found by multiplying the side lengths. b. Multiply side lengths to find areas of rectangles with whole number side lengths in the context of solving real world and mathematical problems, and represent whole-number products as rectangular areas in mathematical reasoning. c. Use tiling to show in a concrete case that the area of a rectangle with whole-number side lengths <i>a</i> and <i>b</i> + <i>c</i> is the sum of <i>a</i> × <i>b</i> and <i>a</i> × <i>c</i>. Use area models to represent the distributive property in mathematical reasoning. d. Recognize area as additive. Find areas of rectilinear figures by decomposing them into non-overlapping rectangles and adding the areas of the non-overlapping parts, applying this technique to solve real world problems. Geometric measurement: recognize perimeter as an attribute of plane figures and distinguish between linear and area measures. 8. Solve real world and mathematical problems involving perimeters of polygons, including finding the perimeter given the side lengths, finding an unknown side length, and exhibiting rectangles with the same perimeter and different areas or with the same area and different perimeters. 	1/4, 1/8). Solve problems involving addition and subtraction of fractions by using information presented in line plots. For example, from a line plot find and interpret the difference in length between the longest and shortest specimens in an insect collection. Geometric measurement: understand concepts of angle and measure angles. 5. Recognize angles as geometric shapes that are formed wherever two rays share a common endpoint, and understand concepts of angle measurement: a. An angle is measured with reference to a circle with its center at the common endpoint of the rays, by considering the fraction of the circular arc between the points where the two rays intersect the circle. An angle that turns through 1/360 of a circle is called a "one-degree angle," and can be used to measure angles. b. An angle that turns through n one-degree angles is said to have an angle measure of n degrees. 6. Measure angles in whole-number degrees using a protractor. Sketch angles of specified measure. 7. Recognize angle measure as additive. When an angle is decomposed into non-overlapping parts, the angle measure of the whole is the sum of the angle measure of the whole is the sum of the angle measure of the whole is the sum of the angle measures of the parts. Solve addition and subtraction problems to find unknown angles on a diagram in real world and mathematical problems, e.g., by using an equation with a symbol for the unknown angle measure.	cubes, using cubic cm, cubic in, cubic ft, and improvised units. 5. Relate volume to the operations of multiplication and addition and solve real world and mathematical problems involving volume. a. Find the volume of a right rectangular prism with whole-number side lengths by packing it with unit cubes, and show that the volume is the same as would be found by multiplying the edge lengths, equivalently by multiplying the height by the area of the base. Represent threefold whole-number products as volumes, e.g., to represent the associative property of multiplication. b. Apply the formulas $V = I \times w \times h$ and $V = b \times h$ for rectangular prisms to find volumes of right rectangular prisms with whole number edge lengths in the context of solving real world and mathematical problems. c. Recognize volume as additive. Find volumes of solid figures composed of two non-overlapping right rectangular prisms by adding the volumes of the non-overlapping parts, applying this technique to solve real world problems. Foundation for Grade 6 Geometry, Statistics and Probability

Ratios and Proportional Relationships

Grade Six

Understand ratio concepts and use ratio reasoning to solve problems.

1. Understand the concept of a ratio and use ratio language to describe a ratio relationship between two quantities.

For example, "The ratio of wings to beaks in the bird house at the zoo was 2:1, because for every 2 wings there was 1 beak." "For every vote candidate A received, candidate C received nearly three votes."

2. Understand the concept of a unit rate a/b associated with a ratio a:b with $b \neq \Box 0$, and use rate language in the context of a ratio relationship.

For example, "This recipe has a ratio of 3 cups of flour to 4 cups of sugar, so there is 3/4 cup of flour for each cup of sugar." "We paid \$75 for 15 hamburgers, which is a rate of \$5 per hamburger."

- 3. Use ratio and rate reasoning to solve real-world and mathematical problems, e.g., by reasoning about tables of equivalent ratios, tape diagrams, double number line diagrams, or equations.
- a. Make tables of equivalent ratios relating quantities with whole number measurements, find missing values in the tables, and plot the pairs of values on the coordinate plane. Use tables to compare ratios.
- b. Solve unit rate problems including those involving unit pricing and constant speed.

For example, if it took 7 hours to mow 4 lawns, then at that rate, how many lawns could be mowed in 35 hours? At what rate were lawns being mowed?

- c. Find a percent of a quantity as a rate per 100 (e.g., 30% of a quantity means 30/100 times the quantity); solve problems involving finding the whole, given a part and the percent.
- d. Use ratio reasoning to convert measurement units; manipulate and transform units appropriately when multiplying or dividing quantities.

Previous Learning from Grade 5 Number and Operations in Base Ten, Number and Operations - Fractions

Grade Seven

Analyze proportional relationships and use them to solve real-world and mathematical problems.

1. Compute unit rates associated with ratios of fractions, including ratios of lengths, areas and other quantities measured in like or different units.

For example, if a person walks 1/2 mile in each 1/4 hour, compute the unit rate as the complex fraction 1/2/1/4 miles per hour, equivalently 2 miles per hour.

- 2. Recognize and represent proportional relationships between quantities.
- a. Decide whether two quantities are in a proportional relationship,
- e.g., by testing for equivalent ratios in a table or graphing on a coordinate plane and observing whether the graph is a straight line through the origin.
- b. Identify the constant of proportionality (unit rate) in tables, graphs, equations, diagrams, and verbal descriptions of proportional relationships.
- c. Represent proportional relationships by equations.

For example, if total cost t is proportional to the number n of items purchased at a constant price p, the relationship between the total cost and the number of items can be expressed as t = pn.

- d. Explain what a point (x, y) on the graph of a proportional relationship means in terms of the situation, with special attention to the points (0, 0) and (1, r) where r is the unit rate.
- 3. Use proportional relationships to solve multistep ratio and percent problems.

Examples: simple interest, tax, markups and markdowns, gratuities and commissions, fees, percent increase and decrease, percent error.

Standards Progressions

The Number System Grade Six Grade Seven Grade Eight Apply and extend previous understandings of multiplication and division to divide fractions by fractions. Apply and extend previous understandings of operations with Know that there are numbers that fractions to add, subtract, multiply, and divide rational numbers. are not rational, and approximate 1. Interpret and compute quotients of fractions, and solve word problems involving division of fractions by fractions, e.g., by using visual fraction models and equations to represent the problem. 1. Apply and extend previous understandings of addition and subtraction them by rational numbers. For example, create a story context for $(2/3) \div (3/4)$ and use a visual fraction model to show the quotient; use the relationship between to add and subtract rational numbers; represent addition and subtraction 1. Understand informally that every multiplication and division to explain that (2/3) \div (3/4) = 8/9 because 3/4 of 8/9 is 2/3 (In general (a/b) \div (c/d) = ad/bc.) How much on a horizontal or vertical number line diagram. number has a decimal expansion; chocolate will each person get if 3 people share 1/2 lb of chocolate equally? How many 3/4-cup servings are in 2/3 of a cup of yogurt? a. Describe situations in which opposite quantities combine to make 0. the rational numbers are those with How wide is a rectangular strip of land with length 3/4 mi and area 1/2 square mi? For example, a hydrogen atom has 0 charge because its two constituents are decimal expansions that terminate in Compute fluently with multi-digit numbers and find common factors and multiples. oppositely charged. Os or eventually repeat. Know that 2. Fluently divide multi-digit numbers using the standard algorithm. b. Understand p + q as the number located a distance |q| from p, other numbers are called irrational. 3. Page | 15

Standards Progressions

Expressions and Equations

Grade Six

Apply and extend previous understandings of arithmetic to algebraic expressions.

- 1. Write and evaluate numerical expressions involving whole-number exponents.
- 2. Write, read, and evaluate expressions in which letters stand for numbers.
- a. Write expressions that record operations with numbers and with letters standing for numbers.

For example, express the calculation "Subtract y from 5" as 5 - y.

b. Identify parts of an expression using mathematical terms (sum, term, product, factor, quotient, coefficient); view one or more parts of an expression as a single entity.

For example, describe the expression 2(8 + 7) as a product of two factors; view (8 + 7) as both a single entity and a sum of two terms.

c. Evaluate expressions at specific values of their variables. Include expressions that arise from formulas used in real-world problems. Perform arithmetic operations, including those involving whole number exponents, in the conventional order when there are no parentheses to specify a particular order (Order of Operations).

For example, use the formulas V = s3 and A = 6 s2 to find the volume and surface area of a cube with sides of length s = 1/2.

- 3. Apply the properties of operations to generate equivalent expressions. For example, apply the distributive property to the expression 3 (2 + x) to produce the equivalent expression 6 + 3x; apply the distributive property to the expression 24x + 18y to produce the equivalent expression 6 (4x + 3y); apply properties of operations to y + y + y to produce the equivalent expression 3y.
- 4. Identify when two expressions are equivalent (i.e., when the two expressions name the same number regardless of which value is substituted into them).

For example, the expressions y + y + y and 3y are equivalent because they name the same number regardless of which number y stands for.

Reason about and solve one-variable equations and inequalities.

- 5. Understand solving an equation or inequality as a process of answering a question: which values from a specified set, if any, make the equation or inequality true? Use substitution to determine whether a given number in a specified set makes an equation or inequality true.
- 6. Use variables to represent numbers and write expressions when solving

Grade Seven

Use properties of operations to generate equivalent expressions.

- 1. Apply properties of operations as strategies to add, subtract, factor, and expand linear expressions with rational coefficients.
- 2. Understand that rewriting an expression in different forms in a problem context can shed light on the problem and how the quantities in it are related.

For example, a + 0.05a = 1.05a means that "increase by 5%" is the same as "multiply by 1.05."

Solve real-life and mathematical problems using numerical and algebraic expressions and equations.

3. Solve multi-step real-life and mathematical problems posed with positive and negative rational numbers in any form (whole numbers, fractions, and decimals), using tools strategically. Apply properties of operations to calculate with numbers in any form; convert between forms as appropriate; and assess the reasonableness of answers using mental computation and estimation strategies.

For example: If a woman making \$25 an hour gets a 10% raise, she will make an additional 1/10 of her salary an hour, or \$2.50, for a new salary of \$27.50. If you want to place a towel bar 9 3/4 inches long in the center of a door that is 27 1/2 inches wide, you will need to place the bar about 9 inches from each edge; this estimate can be used as a check on the exact computation.

- 4. Use variables to represent quantities in a real-world or mathematical problem, and construct simple equations and inequalities to solve problems by reasoning about the quantities.
- a. Solve word problems leading to equations of the form px + q = r and p(x + q) = r, where p, q, and r are specific rational numbers. Solve equations of these forms fluently. Compare an algebraic solution to an arithmetic solution, identifying the sequence of the operations used in each approach.

For example, the perimeter of a rectangle is 54 cm. Its length is 6 cm. What is its width?

b. Solve word problems leading to inequalities of the form px + q > r or px + q < r, where p, q, and r are specific rational numbers. Graph the solution set of the inequality and interpret it in the context of the problem.

For example: As a salesperson, you are paid \$50 per week plus \$3 per sale. This week you want your pay to be at least \$100. Write an inequality for the

Grade Eight

Work with radicals and integer exponents.

1. Know and apply the properties of integer exponents to generate equivalent numerical expressions.

For example, $32 \times 3-5 = 3-3 = 1/33 = 1/27$.

- 2. Use square root and cube root symbols to represent solutions to equations of the form $x^2 = p$ and $x^3 = p$, where p is a positive rational number. Evaluate square roots of small perfect squares and cube roots of small perfect cubes. Know that v^2 is irrational.
- 3. Use numbers expressed in the form of a single digit times an integer power of 10 to estimate very large or very small quantities, and to express how many times as much one is than the other.

For example, estimate the population of the United States as 3×108 and the population of the world as 7×109 , and determine that the world population is more than 20 times larger.

4. Perform operations with numbers expressed in scientific notation, including problems where both decimal and scientific notation are used. Use scientific notation and choose units of appropriate size for measurements of very large or very small quantities (e.g., use millimeters per year for seafloor spreading). Interpret scientific notation that has been generated by technology.

Understand the connections between proportional relationships, lines, and linear equations.

5. Graph proportional relationships, interpreting the unit rate as the slope of the graph. Compare two different proportional relationships represented in different ways.

For example, compare a distance-time graph to a distance-time equation to determine which of two moving objects has greater speed.

6. Use similar triangles to explain why the slope m is the same between any two distinct points on a non-vertical line in the coordinate plane; derive the equation y = mx for a line through the origin and the equation y = mx + b for a line intercepting the vertical axis at b.

Analyze and solve linear equations and pairs of simultaneous linear equations.

- 7. Solve linear equations in one variable.
- a. Give examples of linear equations in one variable with one solution, infinitely many solutions, or no solutions. Show which of these possibilities is the case by successively transforming the given equation into simpler forms, until an equivalent equation of the form x = a, a = a, or a = b results (where a and b are different

Standards Progressions

	Expressions and Equations	
Grade Six	Grade Seven	Grade Eight
a real-world or mathematical problem; understand that a variable can represent an unknown number, or, depending on the purpose at hand, any number in a specified set. 7. Solve real-world and mathematical problems by writing and solving equations of the form $x + p = q$ and $px = q$ for cases in which p , q and x are all nonnegative rational numbers. 8. Write an inequality of the form $x > c$ or $x < c$ to represent a constraint or condition in a real-world or mathematical problem. Recognize that inequalities of the form $x > c$ or $x < c$ have infinitely many solutions; represent solutions of such inequalities on number line diagrams. Represent and analyze quantitative relationships between dependent and independent variables. 9. Use variables to represent two quantities in a real-world problem that change in relationship to one another; write an equation to express one quantity, thought of as the dependent variable, in terms of the other quantity, thought of as the independent variable. Analyze the relationship between the dependent and independent variables using graphs and tables, and relate these to the equation. For example, in a problem involving motion at constant speed, list and graph ordered pairs of distances and times, and write the equation $d = 65t$ to represent the relationship between distance and time. Previous Learning from Grade 5 Operations and Algebraic Thinking	number of sales you need to make, and describe the solutions.	numbers). b. Solve linear equations with rational number coefficients, including equations whose solutions require expanding expressions using the distributive property and collecting like terms. 8. Analyze and solve pairs of simultaneous linear equations. a. Understand that solutions to a system of two linear equations in two variables correspond to points of intersection of their graphs, because points of intersection satisfy both equations simultaneously. b. Solve systems of two linear equations in two variables algebraically, and estimate solutions by graphing the equations. Solve simple cases by inspection. For example, 3x + 2y = 5 and 3x + 2y = 6 have no solution because 3x + 2y cannot simultaneously be 5 and 6. c. Solve real-world and mathematical problems leading to two linear equations in two variables. For example, given coordinates for two pairs of points, determine whether the line through the first pair of points intersects the line through the second pair.

Ohio Department of Education (2/14/12)

Standards Progressions

Functions

Grade Eight

Define, evaluate, and compare functions.

- 1. Understand that a function is a rule that assigns to each input exactly one output. The graph of a function is the set of ordered pairs consisting of an input and the corresponding output.
- 2. Compare properties of two functions each represented in a different way (algebraically, graphically, numerically in tables, or by verbal descriptions).

For example, given a linear function represented by a table of values and a linear function represented by an algebraic expression, determine which function has the greater rate of change.

3. Interpret the equation y = mx + b as defining a linear function, whose graph is a straight line; give examples of functions that are not linear. For example, the function A = s2 giving the area of a square as a function of its side length is not linear because its graph contains the points (1,1) (2,4) and (3,9), which are not on a straight line

Use functions to model relationships between quantities.

- 4. Construct a function to model a linear relationship between two quantities. Determine the rate of change and initial value of the function from a description of a relationship or from two (x, y) values, including reading these from a table or from a graph. Interpret the rate of change and initial value of a linear function in terms of the situation it models, and in terms of its graph or a table of values.
- 5. Describe qualitatively the functional relationship between two quantities by analyzing a graph (e.g., where the function is increasing or decreasing, linear or nonlinear). Sketch a graph that exhibits the qualitative features of a function that has been described verbally.

	Geometry 6-8	
Grade Six	Grade Seven	Grade Eight
Grade Six Solve real-world and mathematical problems involving area, surface area, and volume. 1. Find the area of right triangles, other triangles, special quadrilaterals, and polygons by composing into rectangles or decomposing into triangles and other shapes; apply these techniques in the context of solving real-world and mathematical problems. 2. Find the volume of a right rectangular prism with fractional edge lengths by packing it with unit cubes of the appropriate unit fraction edge lengths, and show that the volume is the same as would be found by multiplying the edge lengths of the prism. Apply the formulas $V = I w h$ and $V = b h$ to find volumes of right rectangular prisms with fractional edge lengths in the context of solving real-world and mathematical problems. 3. Draw polygons in the coordinate plane given coordinates for the vertices; use coordinates to find the length of a side joining points with the same first		Understand congruence and similarity using physical models, transparencies, or geometry software. 1. Verify experimentally the properties of rotations, reflections, and translations: a. Lines are taken to lines, and line segments to line segments of the same length. b. Angles are taken to angles of the same measure. c. Parallel lines are taken to parallel lines. 2. Understand that a two-dimensional figure is congruent to another if the second can be obtained from the first by a sequence of rotations, reflections, and translations; given two congruent figures, describe a sequence that exhibits the congruence between them. 3. Describe the effect of dilations, translations, rotations, and reflections on two-dimensional figures using coordinates. 4. Understand that a two-dimensional figure is similar to another if the second can be obtained from the first by a sequence of rotations, reflections, translations, and dilations; given two similar two dimensional figures, describe a sequence that exhibits the similarity between them. 5. Use informal arguments to establish facts about the angle sum and exterior angle of triangles, about the angles created when parallel lines are cut by a transversal, and the
coordinate or the same second coordinate. Apply these techniques in the context of solving real-world and mathematical problems. 4. Represent three-dimensional figures using nets made up of rectangles and triangles, and use the nets to find the surface area of these figures. Apply these techniques in the context of solving real-world and mathematical problems. Previous Learning in Grade 5 Measurement and Data, Geometry	in a multi-step problem to write and solve simple equations for an unknown angle in a figure. 6. Solve real-world and mathematical problems involving area, volume and surface area of two- and three-dimensional objects composed of triangles, quadrilaterals, polygons, cubes, and right prisms.	angle-angle criterion for similarity of triangles. For example, arrange three copies of the same triangle so that the sum of the three angles appears to form a line, and give an argument in terms of transversals why this is so. Understand and apply the Pythagorean Theorem. 6. Explain a proof of the Pythagorean Theorem and its converse. 7. Apply the Pythagorean Theorem to determine unknown side lengths in right triangles in real-world and mathematical problems in two and three dimensions. 8. Apply the Pythagorean Theorem to find the distance between two points in a coordinate system. Solve real-world and mathematical problems involving volume of cylinders, cones, and spheres. 9. Know the formulas for the volumes of cones, cylinders, and spheres and use them to solve real-world and mathematical problems.

Standards Progressions

•	
Grade Seven	Grade Eight

Develop understanding of statistical variability.

1. Recognize a statistical question as one that anticipates variability in the data related to the question and accounts for it in the answers. For example, "How old am I?" is not a statistical question, but "How old are the students in my school?" is a statistical question because one anticipates variability in students' ages.

Grade Six

- 2. Understand that a set of data collected to answer a statistical question has a distribution which can be described by its center, spread, and overall shape.
- 3. Recognize that a measure of center for a numerical data set summarizes all of its values with a single number, while a measure of variation describes how its values vary with a single number.

Summarize and describe distributions.

- 4. Display numerical data in plots on a number line, including dot plots, histograms, and box plots.
- 5. Summarize numerical data sets in relation to their context, such as by:
- a. Reporting the number of observations.
- b. Describing the nature of the attribute under investigation, including how it was measured and its units of measurement.
- c. Giving quantitative measures of center (median and/or mean) and variability (interquartile range and/or mean absolute deviation), as well as describing any overall pattern and any striking deviations from the overall pattern with reference to the context in which the data were gathered.
- d. Relating the choice of measures of center and variability to the shape of the data distribution and the context in which the data were gathered.

Use random sampling to draw inferences about a population.

1. Understand that statistics can be used to gain information about a population by examining a sample of the population; generalizations about a population from a sample are valid only if the sample is representative of that population. Understand that random sampling tends to produce representative samples and support valid inferences.

Statistics and Probability

2. Use data from a random sample to draw inferences about a population with an unknown characteristic of interest. Generate multiple samples (or simulated samples) of the same size to gauge the variation in estimates or predictions.

For example, estimate the mean word length in a book by randomly sampling words from the book; predict the winner of a school election based on randomly sampled survey data. Gauge how far off the estimate or prediction might be.

Draw informal comparative inferences about two populations.

3. Informally assess the degree of visual overlap of two numerical data distributions with similar variabilities, measuring the difference between the centers by expressing it as a multiple of a measure of variability.

For example, the mean height of players on the basketball team is 10 cm greater than the mean height of players on the soccer team, about twice the variability (mean absolute deviation) on either team; on a dot plot, the separation between the two distributions of heights is noticeable.

4. Use measures of center and measures of variability for numerical data from random samples to draw informal comparative inferences about two populations. For example, decide whether the words in a chapter of a seventh-grade science book are generally longer than the words in a chapter of a fourth-grade science book.

Investigate chance processes and develop, use, and evaluate probability models.

- 5. Understand that the probability of a chance event is a number between 0 and 1 that expresses the likelihood of the event occurring. Larger numbers indicate greater likelihood. A probability near 0 indicates an unlikely event, a probability around 1/2 indicates an event that is neither unlikely nor likely, and a probability near 1 indicates a likely event.
- 6. Approximate the probability of a chance event by collecting data on the chance process that produces it and observing its long-run relative frequency, and predict the approximate relative frequency given the probability. For example, when rolling a number cube 600 times, predict that a 3 or 6 would be rolled roughly 200 times, but probably not exactly 200 times.
- 7. Develop a probability model and use it to find probabilities of events. Compare probabilities from a model to observed frequencies; if the agreement is not good,

Investigate patterns of association in bivariate data.

- 1. Construct and interpret scatter plots for bivariate measurement data to investigate patterns of association between two quantities. Describe patterns such as clustering, outliers, positive or negative association, linear association, and nonlinear association.
- 2. Know that straight lines are widely used to model relationships between two quantitative variables. For scatter plots that suggest a linear association, informally fit a straight line, and informally assess the model fit by judging the closeness of the data points to the line.
- 3. Use the equation of a linear model to solve problems in the context of bivariate measurement data, interpreting the slope and intercept. For example, in a linear model for a biology experiment, interpret a slope of 1.5 cm/hr as meaning that an additional hour of sunlight each day is associated with an additional 1.5 cm in mature plant height.
- 4. Understand that patterns of association can also be seen in bivariate categorical data by displaying frequencies and relative frequencies in a two-way table. Construct and interpret a two-way table summarizing data on two categorical variables collected from the same subjects.

Use relative frequencies calculated for rows or columns to describe possible association between the two variables.

For example, collect data from students in your class on whether or not they have a curfew on school nights and whether or not they have assigned chores at home. Is there evidence that those who have a curfew also tend to have chores?

	Statistics and Probability	
Grade Six	Grade Seven	Grade Eight
	explain possible sources of the discrepancy. a. Develop a uniform probability model by assigning equal probability to all outcomes, and use the model to determine probabilities of events. For example, if a student is selected at random from a class, find the probability that Jane will be selected and the probability that a girl will be selected. b. Develop a probability model (which may not be uniform) by observing frequencies in data generated from a chance process. For example, find the approximate probability that a spinning penny will land heads up or that a tossed paper cup will land open-end down. Do the outcomes for the spinning penny appear to be equally likely based on the observed frequencies? 8. Find probabilities of compound events using organized lists, tables, tree diagrams, and simulation. a. Understand that, just as with simple events, the probability of a compound event is the fraction of outcomes in the sample space for which the compound event occurs. b. Represent sample spaces for compound events using methods such as organized lists, tables and tree diagrams. For an event described in everyday language (e.g., "rolling double sixes"), identify the outcomes in the sample space which compose the event. c. Design and use a simulation to generate frequencies for compound events. For example, use random digits as a simulation tool to approximate the answer to the question: If 40% of donors have type A blood, what is the probability that it will take at least 4 donors to find one with type A blood?
